Solar reflective surfaces

Highly reflecting specular surfaces The highly reflecting **vega_{energy}** specular surfaces are a key component of concentrating solar systems. They concentrate the solar radiation precisely to achieve extreme energy densities.

By using **vega_{energy}** mirrors with their outstanding reflecting properties the performance can be increased significantly in concentrating parabolic systems (CSP) for the generation of solar thermal electricity, or process heat for industrial applications, air conditioning or sea water desalination. Performance improvements can also be reached by using **vega_{energy}** mirrors in combinations with flat plate or vacuum tube solar thermal collectors and in combination with PV arrays.

The product range Almeco offers a range of reflector materials suitable for all applications in the solar energy field.

For glazed solar collectors where standard anodized aluminium does not provide enough reflectance, the vacuum coated products **vega_{SP195}** and **vega_{SP198}** provide very high levels of total and specular reflectance with excellent coating integrity, durability and U.V. resistance. Optimum reflectance of the solar spectral range is obtained applying carefully controlled reflection enhancing layers, using continuous PVD (Physical Vapour Deposition) vacuum coating technology. These materials give reflection values of over 95% and 98% respectively on the vacuum coated strip. **vega_{SP295}** and **vega_{SP298}** are the top mirror finish versions of this range, with higher concentrating and reflecting characteristics and lower light diffusion.

The **vega_{SP}** range of products is ideal for energy saving projects in indoor or protected environments.

The WR range reflector materials for external applications results from our ongoing research effort, which is driving towards even greater performance, combining higher mirror reflectance with longer product life. In these products the high reflectance **vega** surface is provided with an additional robust, highly transparent and weather resistant barrier coat that assures a long term high reflectivity performance in outdoor reflector applications. With their high maintained reflective performance, these products are designed for the manufacture of external solar reflectors.

Photovoltaic installations can benefit from enhanced sunlight exposure by incorporating in their **Photovoltaic systems**, design **vega_{energy}** mirrors to re-direct energy onto the cell surfaces. A number of designs have been **solar thermal and secondary reflectors** developed to improve PV array output, ranging from full parabolic systems and tracking modules to simple side reflectors on fixed arrays.

For large parabolic reflectors for process heat generation demanding high performance, **vega_{WR193}** with 90% solar reflectance, is the right choice. For smaller reflectors, for instance concentrators for vacuum tube arrays (CPC), where reflector life is a key factor but the best reflectivity performance is not essential, the SWR686 product is an ideal solution. Its 87% total reflectance and 84% solar reflectance are protected by a transparent weather resistant hydrophobic (water-repellent) top coat which guarantees long life in outdoor applications.

In Fresnel or large parabolic systems where imperfect focusing can lead to energy losses, **vega** aluminium can be adapted to make reflectors for use as secondary focusing mirrors with precise parabolic curvature to capture and re-focus solar energy on the absorber tube.

The high reflectance characteristics of **vega_{WR193}** make this aluminum product ideal for general use **Concentrating parabolic systems** in the construction of reflective surfaces for solar energy generation, including process heating, air conditioning systems and seawater desalination. For more critical larger parabolic concentrators where optimum focusing of solar radiation is essential, **vega_{WR293}** with his higher specular efficiency and the same high level of surface protection promotes greater energy focusing with up to 5% more energy reaching the absorber tube from the primary reflecting mirrors.

Whatever type of reflector system is desired, we can help providing the solution.

Material characteristics and mechanical properties

Base material	Pre-anodized aluminium 1090 alloy purity 99.9%	Availability	Sheets or coils max. width 1,250 mm thickness 0.3 – 0.8 mm
Specification	UNI-EN 573-3	General tolerances	Thickness ± 0.03 mm
Temper	Nominal H18 Specification UNI-EN 485-2		Width ± 0.15 mm
Tensile strength [MPa]	125 - 180		Length (cut sheets) ± 1 mm/m
Proof stress [MPa]	105 - 170		
Elongation [%]	> 2	Note	All products above can be delivered in various sizes and shapes according to customer requirements

All information provided is based on up-to-date values where possible. Optical values are average results from 0.4 mm metal and are published for guidance only; they may vary according to raw material thickness. For more detailed information please contact our technical sales department. Physical characteristics of the materials are in accordance with EN (European Committee for Standardization).

Product vega_{SP} products are based on pre-anodized aluminium strip, PVD coated **characteristics** with a multi-layer reflection stack.

vega_{WR} products are additionally coated with a highly transparent and protective UV and weather resistant top coat.

Specular SWR products are made using pre-anodized aluminium coated with a special weather resistant top coat.

Resistance testing
and long term
product performance

Physical tests	Standard	Result	Corrosion tests	WR PRODUCTS	
Cross hatch adhesion test	EN ISO 2409	No loss of coating adhesion	UV resistance	EN ISO 4892-3	< 0.5% reflectance change in 1000 h
180° bend test	BS EN ISO 1519	No coating failure	Neutral salt spray	ASTM B 117 ISO 9227 NSS	< 1% reflectance loss after 3000 h
Falling ball impact test	BS EN ISO 6272-1	No coating failure	Humidity resistance	ISO 4623	< 0.5% reflectance change after 500 h

Almeco guarantees that reflectance of the mirrors will be maintained within 3% of their original value for 10 year period.*

Products with protective tape are guaranteed for six months after delivery if they are stored in a conditioned room (temperature 20-30°C and relative humidity 50-60%) and kept away from sunlight and any heating source. Protective tape is not UV resistant.

For more than fifty years the Almeco Group has devoted itself to making aluminium products with reflective and decorative surface finishes. This specialization has led to the Group becoming one of the world's largest producers of components for the lighting and solar energy industries.

The Company

All **vega_{energy}** products are manufactured in Germany at Almeco GmbH, which incorporates the Solar Business Division of Almeco Group. With modern, high technology vacuum coating and manufacturing lines, Almeco GmbH specializes in high-tech reflector and absorber coatings that convert sunlight into heat energy in an efficient, reliable and environmentally friendly manner.

vega_{energy} is "made in Germany". In Bernburg (Saxony-Anhalt), Almeco installed one of the most modern PVD coating systems in the world for roll-to-roll manufacturing of highly reflective aluminium surfaces.
